

Hooking up your Fender® Passport® PDP-Series Speakers

PDP-1 PASSIVE SPEAKERS (NON-POWERED):

These speakers require a power source such as a powered home theatre receiver or low power stereo power amplifier. *Please refer to the supplied owner's manual for impedance requirements (ohms) and power handling (watts).*

If you are using your PDP-1 speakers with your flat-panel TV (Plasma, DLP, LCD, etc), you may be able to use the speaker outputs to provide sound to your PDP-1 speakers as shown below.

Note: The PDP-1 (non-powered) speakers will not operate without the appropriate powered amplifier or home theatre receiver. The PDP-S50 powered subwoofer only provides power to itself and will not be able to power the PDP-1 speakers.

PDP-125 POWERED SPEAKERS:

These speakers are self-powered and only require line-level audio from any audio source such as a computer, portable mp3 player, television, etc *Please refer to the supplied owner's manual for more information on setting up your PDP-125 speakers.*

If you are using your PDP-125 speakers with the optional PDP-S50 powered subwoofer (sold separately), you can connect your audio source into the PSP-S50 powered sub with the supplied cables and connect to the PDP-125 powered speaker system directly from the PDP-S50 sub.

Note: The PDP-125 (powered) speaker system will work as a independent stereo speaker system or if used with the optional PDP-S50 (powered subwoofer), operate as a 2.1 home theatre speaker system.
